cellular immunity test

antigen-specific CTLs

	CODE	TEST NAME	SPECIMEN REQUIREMENT (mL)	CONTAINER	STORE TEMPERATURE (STABILITY)	TURNAROUND TIME (DAY)	METHODOLOGY	REFERENCE RANGE (UNIT)	COMMENT
antigen-specific CTLs	6864 2	Specified days Cytomegalovirus-specific CTL assay (HLA-A*0201)	whole blood 5.0 (with heparin)	PH5	R	3-5	Flow cytometry (FCM)	(%)	Orders accepted on specified days. Orders can be accepted from Monday through Thursday. This test is indicated for patients with HLA-A genotype *0201. It is not available for patients with other genotypes.
	6868 1	Specified days Cytomegalovirus-specific CTL assay (HLA-A*2402)	whole blood 5.0 (with heparin)	PH5	R	3-5	Flow cytometry (FCM)	(%)	Orders accepted on specified days. Orders can be accepted from Monday through Thursday. This test is indicated for patients with HLA-A genotype *2402. It is not available for patients with other genotypes.

"Tetramer" is a trademark of SRL Inc. in Japan.

About the submission of samples for tetramer tests

Please submit a sample on the day it is collected.

About the tetramer method

In the tetramer method, MHC (major histocompatibility complex) is first bound with a targeted antigenic peptide to prepare a monomerized biotinylated MHC class I / peptide complex.

If left as it is, this monomer reduces the strength that binds itself with a targeted cell: thus it is bound with PE (Phycoerythrin) -labeled streptavidin to make it a tetramer and enhance the bonding strength. (Bottom left figure)

Testing with this tetramer is very helpful in analyzing CTLs (Cytotoxic T lymphocytes), which play a key role in eliminating virus-infected cells and cancer cells, among others.

While the conventional CTL analysis evaluates the ratio of CD8 in the lymphocytes, the tetramer method allows us to quantitatively analyze antigen-specific CTLs.

This is very valuable both immunologically and clinically as a means to monitor the immune state of a patient with an infectious disease or cancer. (Bottom figure)
